MODULE 4 Hazard Communication. Hazard communication, also known as HazCom, is a set of processes and procedures that employers must implement in the workplace to effectively communicate hazards associated with chemicals during handling, shipping, and any form of exposure. OSHA requires that any employer with hazardous chemicals in the workplace must design and institute a written hazard communication program, which includes labeling all containers, giving all employees access to safety data sheets, and conducting a training program for all employees who could be exposed to the hazards. This course will provide general information for Hazard Communications. **Training needs to be completed on an annual basis.** This training is auto-assigned by HR at the time of hire. Repeat training may be accessed through https://utah.bridgeapp.com/
